Kilumen : Start of a Journey

This game is modeled after a legendary series that no longer produces its classic style. The game is a 2D 128 bit open world creature battler. That game is Pokemon, and its early releases up to its 2016 release is what we are studying for development. Game balance and mechanics, items, building dynamic zones that house villages, towns and unique creatures and features.

A few key points:

Creatures: they should all have their own primary type and each has a counter and imunity. Also some have sub types which can alter their counter and vulnerability. Main types include Earth, fire, water, wind, Light, dark, mystic, legendary. Sub types could be grass, bug, sea or fresh water, swamp, rain, magma, dragos, bird, spirit, ghost, demon, angelic, god and devil. We can add more to make it make sense or balance the game. I expect 450 creatures with atleast 350 having 2-3 evolutions each and then a small chance for those creatures to recieve a roll for a buff on entry to battle, those will be similar to shiny in pokemon. Modifiers such as Large for def and health, small for agility, cosmic for replacing shiny from pokemon, aggresive for attack boost. These should all be reflected on their model so users know what variant they are by looking. For game balance sake we can have about an equal number of all the types except for light dark and mystic, legendary add those amounts to keep the game balanced, they should be rare to find in open world. Every creature has a certain region they appear in and no where else unless its a common bird or bug type.

World: We need 13 entirley different zones for story pruposes. These need to be a mix of 4 towns, 3 cities, and 6 out door biomes. These will house our "Masters" you have to defeat each master to gain his challenge coin which will allow you to challenge the battle masters of the region. There are 8 battle masters, each master of the 15 all have unique creature line ups and their levels reflect where in the story line your creatures should be by this time. Leading up to the masters city there should be a stretch of "open world" with clear contsrtains like in pokemon where you can freely explore within the map thats available. This should have a blanced amount of trainers to fight to help level up and get gold without it being too easy or rewarding. There should be a different amount of Helper trainers to defeat in each master zone except for the Battle masters, which you will be in a arena and you must defeat them all without leaving or puting your pokemon on healing machines. We do need some open areas for exploration or

optional paths to the same place. Caves, water areas, forrest and swamps in the same style that pokemon platnium and soul silver do it.

Plot: The plot is that the world is full of adventure and most people dont know how expansive the Kilumen world is. You work full time for a company who leads the charge on learning and data cataloging the Kilumen. Your primary quest sequence is to become a battle master which is your personal agenda, however the company gives you tasks to complete as well which idly fuels expanding and leveling your beasts. Total catch cout, catch count in specific regions, catching the same kilumen over and over to a specific ammount that scales up tp 150 from 1 to 3 to 5 to 10 to 20 to 30 to 50 to 75 to 100. Each mileston gives you in game currency. Also discovering evolutions, and some beasts can only be obtained by breeding, about 5 of them which is one of your tasks as well. Feeding different feeds to each beast is also critical to the research of their manufactured feed. Feed is meant to help them grow, get rid of status effects, or boost stats temporarily. The more you push the companies agenda the more likely you are to trigger the quest for the Legendary Gaurdian, who will attack you in a battle format and you can win or lose or dominate the beast but winning and capture are low chances.

Ownership and economy: There is no inflation or any ability to own any buildings. The shops prices stay fixed for the whole game and they are region based. You can sell extra beasts to your company for money and progress towards your sell goals. Top sell goal is 2000 beasts.

Dark undertones: you use a dominance crystal to bond your soul to the kilumen, thats how you make them fight along side you, this should avoid any copyright issues with nintendo. There are clear opppositions in the game to the capture, forced servitudes, and battling from small groups in the hidden parts of the world that highlight the company you work for does inhumane testing without just saying it aloud.

Battle: battle follows the same style as pokemon, 2D across from each other. Turn based and there is an energy meter. Each attack consumes energy and has a realistic limit to how many times it can be used before you must take your kiluman to a treatment center to let it rest. Using skills after energy depletion causes imediate damage, higher chance to miss, and reduced damage. Every battle action has a simple animation same as pokemon.

Open world kilumen catching: it is very rare to be walking and get attacked out side the grassy zones, if you do get attacked it is always an agressive variant. Inside the grass it can be any variant or kiluman for that zone.

Items: You can buy items for your beasts but it wont change the look in battle if you equipt it. They only get one slot. Battle armor for def, training dummy for xp boost, gold coin for extra money in battles where it fights, boxing gloves for more attack, a pair of binoculars that grants you insight on what attack the other trainer plans to use and esitmated damage range. Also healing potions to get rid of any status effects, restore energy, or health. And the feed we talked about as well. All shops are owned by your comapany Revival Tech that you shop at.

Mechanics: there needs to be a place to breed, a place to buy the items, a place to heal your beasts, a station for paid quick travel anywhere over land and one for anywhere over water. You have a smart phone where you track quests, company tasks, mini map, team, inventory and stat tree. Every task you complete levels your emplyee ID up giving you new bonuses, like extra cash or company xp and one point for the "Company Benifits Board" where you use your points to enroll in gmae changing benifits, like free fast travel, discounts that add up at the store, increased payouts, increased dominance crystsl affectivmens, increased battle damage for all of your beasts, increased xp for all of your beast, increased health for all of your beasts, walk speed, energy level increase for beast, and even acces to resticted levels of company property.

Plan to achieve high quality: Reuse the same assets where we can for city or town building such as houses and shops, reuse the same ground and grass or tree assets to build any regualr open world zone, create a blueprint for how the cities and towns are laid out before starting to place assets, review how pokemon does it to get an authentic feel. Create reusable trainer models, each one get its own name and team of pokemon that never changes but the hooded trainer stays hooded to make it bisexual use. Only masters get unique character models. The mc gets to choose between one male or one female character that only shows in cutscenes or battle, open world models are squished the same way pokemon does it, and slight animations to show walking, other characters bobbing while idle and turning left or right in place, grass moves slighlty to simulate wind, and we can add moving shadows to simulate cloud coverage. We can also add rain and snow where apllicable.

Story plot: You have a dream that shows you in a river stuck, next page shows a trainer on the side of the river looking at you, next one shows you on the bank next to him and his beast. You wake up and go down stairs, talk to your room mate who works with you, Ron. You talk about

how slow work has been and how the company might do lay offs. When you walk to work in the town you live in both of you get promoted by your boss to field researchers since other company employess stopped reporting back and are assumed missing. This starts your stroy off, you talk to your room mate and have the option of working together to make the game easier or becoming friendly rivals which makes the game as intended, hes the bar. Every city you visit you battle him to see if your progress is on track, he should be the same difficulty as the entery level trainers for the master. Dominance crystals work by selecting it and the target becomes opaque depending on how affective it is, they disapear once captures. Need a pokedex like pokemon but we call it the Kilindex shows how many of each one you have caught, the biggest and smallest weights, regions they can be caught, known types, known skills. Need small side quests like any open world rpg. And hidden loot items for players to find like feed bags or stronger dominance crystals. The game play loop mixed the need for company development through capture and training with personal agenbda to become a battle master. This should keep the plot in line and push players for realistic goals and time lines. Just need to make sure its not too easy. Loading screens are a msut for this operation, the only asset id that needs read technically are the trainers since the grass is the spawn zone and will be coded for random ticks inside of the area WHILE MOVING. Movement is 100% crucial to the tick timing, the specific block they are on has zero meaning, the game rolls the mob spawn for the interaction first from the spawn pool of that region then it rolls the battle trigger. This stops asset ids from needing to be drawn in the grass ahead of time since the game will draw the asset id needed for the battle instead of all 450 models in every grass patch, do a lot of research on the way pokemon does this to see if there are more streamlined or easier ways, but creating a new way is acceptable too we can be pioneers.
